## 1933 - 1934 PRICE LIST

### EVERGREEN - TREE - SHRUB SEEDS

ALL SEEDS OFFERED ARE FRESHLY COLLECTED OF THIS SEASON'S CROPS. THE PRICES ARE F. O. B. GERMANTOWN, BAGS AND PACKING AT COST. 1/4 LB. SOLD AT LB. RATE.

### SPECIAL NOTICE

CUSTOMERS DESIRING SMALLER QUANTITIES THAN AN OUNCE CAN ORDER 1/4 OUNCE OR 1/2 OUNCE, - PROVIDING THE RATE IS NOT LESS THAN 15¢ FOR EACH ITEM, AS THIS IS THE LOWEST PRICE FOR WHICH 1/4 OUNCE OR 1/2 OUNCE WILL BE SOLD. HOWEVER, PACKETS WILL BE SOLD AT THE FOLLOWING RATES: 1 TO 50 AT 15¢ EACH, 50 OR OVER AT 10¢ EACH - YOUR SELECTION.

### \$1.00 SPECIAL EVERGREEN COLLECTION

ONE PACKET OF EACH OF THE FOLLOWING EVERGREENS: NORWAY SPRUCE, WHITE PINE, AUSTRIAN PINE, JAPANESE YEW, ORIENTAL ARBORVITAE, MUGHO PINE, COLORADO DOUGLAS FIR, COLORADO BLUE SPRUCE, WHITE SPRUCE, EUROPEAN LARCH - SEPARATELY LABELED - POSTPAID FOR \$1.00.

## PRACTICAL PLANTING SUGGESTIONS

STORING AND STRATIFYING SEEDS - All seeds must be properly cared for as soon as they are received to insure the best results. Most of the Evergreens, excepting the Junipers, can be stored in air-tight containers in a cool, dry place not over 40 degrees in temperature. The Deciduous seeds should be mixed in damp peat moss and kept in a damp condition at a cool temperature not over 40 degrees. Be sure to mix the seeds every few days to prevent them from moulding. The Juniper seeds require the same treatment as the Deciduous seeds. Also, it takes a year for these seeds to germinate. Just as soon as the ground is in condition for planting, sow both your Evergreen and Deciduous seeds in the spring.

LOCATION OF SEED BEDS - Select the position of your seed beds where there is a gentle slope, just enough to permit perfect drainage. For most localities in the United States, a northern or western aspect is the best, not only because the vegetation starts later in the spring and is less likely to be injured by frost, but also the loss of water through evaporation from the surface soil is not so rapid. It is well to have your beds protected from the heavy east and northeast winds by a woodland, hedge, planting or fence. Do not select narrow alleys or at the base of deep canyons, as such positions are subject to frost damage and the growth is checked by lack of direct sunlight for a large part of the day.

BEST SOIL FOR SEED BEDS - Deep and fresh sandy loam is the best soil for your seed beds. Avoid heavy clay as it is difficult and expensive to work and is not easily drained. If your soil is heavy, add a liberal amount of sand and humus; if of a very light sand, it can be improved by adding well rotted manure. Be sure, however, to keep in mind that seedlings grow better and make more and better roots in deep soil of a good quality.

SEED BEDS - Seed beds are usually four feet wide with two feet walks between the beds. The soil should be thoroughly spaded or ploughed to a depth of at least one foot, then harrowed or raked until the soil is in a fine condition. If the soil needs to be enriched, well rotted stable manure or leaf mold can be worked in. DO NOT USE FRESH MANURE.

PLANTING SEEDS - Evergreen and small seeds of shrubs and trees are usually sown broadcast, while the larger seeds such as Oak, Hickory, and Chestnut are sown in drills. Do not sow too thickly, and before sowing it is advisable to roll the beds as it firms the surface soil and makes it possible to retain moisture. When seed is broadcasted, it should be immediately pressed into the soil by a roller or any flat surfaced tool. Surface soil should not be used in covering the seeds but sifted soil taken from a foot or more below the surface. Be sure when covering the beds that only sufficient soil be applied to cover the seed. For example, 1/4 inch is ample for Evergreen species when the beds are protected by mulching or other covering after seeding. Seeds sown in drills should be covered 1 to 4 times the average diameter of the seed. This, of course, greatly depends on the locality and kind of soil. Deeper covering is necessary on sand and loam than on clay soil. Dry sandy soils require a deeper planting than heavy moist soils. Shade is essential after seed is sown, as seed germinates best in darkness. This can be accomplished by making a sash out of building lath made into handy frames and fastened on posts about 18 inches above the ground. Burlap, straw, and salt hay are also used after the seed has been sown. These materials must be removed as soon as the seedlings appear. Keep the beds shaded with the lath frames when the sun is strong so as to prevent the seedlings from burning out.
